# You've got the power

INTRODUCTION TO SQL SERVER

John MacKintosh Instructor

## **CRUD** operations

#### **C**REATE

- Databases, Tables or views
- Users, permissions, and security groups

#### **READ**

• Example: SELECT statements

#### **UPDATE**

Amend existing database records

#### DELETE

#### CREATE

- CREATE TABLE unique table name
- (column name, data type, size)

```
CREATE TABLE test_table(
  test_date date,
  test_name varchar(20),
  test_int int  maximum number of characters that can be stored in this column
)
```

#### A few considerations when creating a table

- Table and column names
- Type of data each column will store
- Size or amount of data stored in the column

## Data types

#### Dates:

- date( YYYY-MM-DD ), datetime( YYYY-MM-DD hh:mm:ss )
- time

#### Numeric:

- integer, decimal, float
- bit ( 1 = TRUE , 0 = FALSE .Also accepts NULL values)

#### Strings:

• char , varchar , nvarchar

# Let's create some tables!

INTRODUCTION TO SQL SERVER

# Insert, Update, Delete

INTRODUCTION TO SQL SERVER

John MacKintosh Instructor

#### **INSERT**

```
INSERT INTO table_name
INSERT INTO table_name (col1, col2, col3)

INSERT INTO table_name (col1, col2, col3)
VALUES
    ('value1', 'value2', value3)
```

#### INSERT SELECT

```
INSERT INTO table_name (col1, col2, col3)
SELECT
   column1,
   column2,
   column3
FROM other_table
WHERE
   -- conditions apply
```

- Don't use SELECT \*
- Be specific in case table structure changes

#### **UPDATE**

```
UPDATE table
SET column = value,
WHERE
-- Condition(s);
```

• Don't forget the WHERE clause!

```
UPDATE table
SET
   column1 = value1,
   column2 = value2
WHERE
   -- Condition(s);
```

#### DELETE

DELETE
FROM table
WHERE

-- Conditions

• Test beforehand!

TRUNCATE TABLE table\_name

• Clears the entire table at once

# Let's INSERT, UPDATE, and DELETE!

INTRODUCTION TO SQL SERVER

# Declare yourself

INTRODUCTION TO SQL SERVER

John MacKintosh Instructor

#### Variables

```
SELECT *
FROM artist
WHERE name = 'AC/DC';
```

Now change the query for another artist:

```
SELECT *
FROM artist
WHERE name = 'U2';
```

#### To avoid repetition, create a variable:

```
SELECT *
FROM artist
WHERE name = @my_artist;
```

#### **DECLARE**

**DECLARE** @

Integer variable:

DECLARE @test\_int INT

Varchar variable:

DECLARE @my\_artist VARCHAR(100)

#### SET

Integer variable:

```
DECLARE @test_int INT
```

Assign value to @my\_artist:

DECLARE @my\_artist varchar(100)

SET @my\_artist = 'AC/DC'

```
DECLARE @my_artist varchar(100)
DECLARE @my_album varchar(300);

SET @my_artist = 'AC/DC'
SET @my_album = 'Let There Be Rock';

SELECT --
FROM --
WHERE artist = @my_artist
AND album = @my_album;
```

```
DECLARE @my_artist varchar(100)
DECLARE @my_album varchar(300);

SET @my_artist = 'U2'
SET @my_album = 'Pop';

SELECT --
FROM --
WHERE artist = @my_artist
AND album = @my_album;
```

## **Temporary tables**

```
SELECT
col1,
col2,
col3 INTO #my_temp_table
FROM my_existing_table
WHERE
-- Conditions
```

• #my\_temp\_table exists until connection or session ends

```
-- Remove table manually

DROP TABLE #my_temp_table
```

# Let's declare some variables!

INTRODUCTION TO SQL SERVER

# Congratulations!

INTRODUCTION TO SQL SERVER

John MacKintosh Instructor

#### What we learned...

- Selecting: SELECT
- Ordering: ORDER BY
- Filtering: WHERE and HAVING
- Aggregating: SUM , COUNT , MIN , MAX and AVG
- Text manipulation: LEFT , RIGHT , LEN and SUBSTRING

#### What we learned (II)...

- GROUP BY
- INNER JOIN , LEFT JOIN , RIGHT JOIN
- UNION and UNION ALL
- Create, Read, Update and Delete (CRUD)
- Variables
- Temporary tables

## **Next Steps**

- Intermediate SQL Server
- Joining Data in SQL

# Congratulations!

INTRODUCTION TO SQL SERVER
